

VORTEC IGNITION KITS FOR GM TRUCKS

Each Vortec Ignition Kit Includes a BilleTech Distributor, a 48,000 Volt Coil and a set of Extreme 9000 Ignition Wires.

Are you looking for the ultimate power package for your late model GM Vortec V6 & V8 engine? ACCEL has the answer with the NEW CNC-machined aluminum Vortec Distributor, Super Stock Coil and EXTREME 9000 plug wires. Not only does this system offer the best in durability, it will give more fire power to the plugs resulting in better performance and gas mileage. These are great upgrades for off-roading, towing and street performance.

The NEW BILLETECH distributors are built with an aircraft grade aluminum housing that makes it an excellent upgrade from the original problem prone plastic distributor from GM. Yes, the GM version is plastic, and is subject to cracking at high rpm, causing poor idle and power loss. The super strong steel shaft and special bearings help ensure long life and durability. High performance cap and rotor included.

1996-02 7.4L Vortec engines with flat cap#VT3

COIL

The new Super Stock coil features 48,000 volts and is a direct bolt in replacement coil for the factory unit, no special brackets needed. Improvements will be noticed throughout the RPM range due to the longer spark duration which helps keep the plugs clean and offers better performance. The black E-coated housing prevents corrosion while the yellow body of the coil lets you know that it's a genuine ACCEL performance coil.

WIRES

The ACCEL Extreme 9000 wires are made to handle any towing, off-roading or hard work you can put them through. The custom fit wires require no cutting or splicing. The low resistance wires are a great upgrade from the factory wires and offer improved throttle response. Special core allows them to be used with aftermarket stereo systems w/o causing radio interference. The space age heat-reflective coated spark plug boots are perfect when using aftermarket headers causing your plug boots to last far longer than standard plug wires.
